

Website Theme:

Axon empowers fitness enthusiasts with premium supplements. Clean, vibrant design reflects health and vitality. Interactive product pages make shopping intuitive. Green accents highlight growth, energy, and wellness.

AI NECESSITY:

AI images save time and resources compared to traditional photography. They allow quick visualization of product concepts and designs. AI ensures consistency in style, color, and branding across pages. They provide creative flexibility for marketing, mockups, and promotions.

AI:

The AI used to create the images was Gemini AI.

PROMPTS WITH RESPECTIVE IMAGES

For this image, we used Google Gemini. We uploaded a sample product box and asked it to change the brand name to “AXON” and adjust the colors to match our theme. It generated the correct result on the first try.

After downloading the image, we removed the background using BackgroundRemover.ai and did a small resize so it would fit better on the website. No major editing was needed.

We used AI mainly because it was faster, more consistent, and helped us create clean, branded product images without needing photography or designing everything from scratch.

AI USAGE AND IMPLEMENTATION

Why AI was Suitable for the Theme

Generative AI was highly suitable because it allowed us to create a visually consistent and unique brand identity for AXON Nutrition. Creating a full line of professional-grade product photography—including protein powder, creatine, and glutamine—would have been expensive and time-consuming. AI allowed us to generate high-quality, perfectly lit, and uniform product mockups quickly and efficiently without the cost and logistics of a professional photoshoot.

Challenges in Prompt Engineering

The primary challenge in prompt engineering was achieving a perfectly consistent bottle and label design across all 10+ products (powders, capsules, liquids, and the book). Initial attempts resulted in variations in the AXON logo font, jar dimensions, and label placement. This was resolved by meticulously defining parameters such as "matte black or primary color container," "white label," and "product title in bold white sans-serif font" in every single prompt, which significantly increased the number of attempts needed before achieving the desired brand cohesion.

Ethical Considerations in Using AI Imagery

We prioritized ethical use by strictly adhering to the project's guidelines. We ensured that all AI-generated content is clearly disclosed and labeled on the website itself, as using AI for product

imagery is considered a dishonest practice in real e-commerce. We provided proper attribution to the AI tool used and included a prominent disclaimer stating that all images are AI-generated, promoting transparency. We also focused on creating generic mockups to avoid infringing on the trademarks of existing supplement brands.
